

Prof. Richard Aldrich

Dr. Aldrich, an ion channel biophysicist, studies the structure and function of proteins involved in interand intracellular communication. Pioneered the study of physical mechanisms that determine whether ion channels are open or closed. He demonstrated a 'ball and chain' mechanism for shutting off potassium channels

and delineated how depolarization and calcium operate jointly to open calcium-activated potassium channels, thus illuminating both channel inactivation and activation. His lab developed a quantitative model of this process that is applicable to the study of other proteins.
